

## How We Help

With the Midwestern BioAg approach, our expert consultants will help you:

- Test your soil and provide a customized balance of nutrients
- Use fertilizers that enhance soil life and plant roots
- Create maximum plant diversity with cover crops and rotations
- Build soil organic matter to improve soil water- and nutrient-holding capacity
- Manage soil structure while balancing soil, air and water
- Support soil life with fertilizers infused with organic matter and essential nutrients that feed both the soil and the crop

We service conventional and organic operations, large and small. We support all types of crops, as well as livestock. We offer:

- Dry fertilizer blends
- Liquid fertilizers
- Soil amendments
- Soil tests
- Seed
- Livestock nutrition
- Specialized full-farm consulting
- Organic transition consulting

## Healthier Soils: We'll Show You How

At Midwestern BioAg, we help you grow yields, increase profits and improve soil health. The goals are linked — our approach is designed to increase production this season while building soil health for future seasons. Our growers can see the clear difference — in yields, plant health, forage quality and the soil itself.

# Better Farming Through Better Soil™

## Better for Over 30 Years

Our mix of proprietary products has a 30-year track record of success. Our proven approach to farming has helped producers increase yields and profits, and grow healthier, more resilient plants. We can do the same for you.

At Midwestern BioAg, we continuously improve our products and practices. Our revolutionary new TerraNu Nutrient Technology™ transforms dairy manure into a dry granular fertilizer infused with key nutrients. We work closely with our network of growers to ensure that they benefit from the right products and practices for their soils.

For us, and for our producers, it's not about *sustaining*, it's about *improving*.

## Better for Plants & Soil

Every aspect of our program promotes soil health, is gentle on roots and soil microbes, and optimizes plant growth, resiliency and quality.

Our fertilizers are formulated to fit your fields.

- **Balanced.** We blend the right nutrients for your soil and crops to help optimize yields and quality. We address yield-limiting factors by complementing NPK with calcium, sulfur, micronutrients and organic matter to feed soil life and increase nutrient availability.
- **Healthier for the soil.** Our fertilizers contain high-quality materials that stimulate and support both soil microbes and plant roots.
- **Available season-long.** Many fertilizers give plants a quick charge for a short period; our fertilizers deliver nutrients throughout the growing season. We mix soluble nutrients with others that are available season-long, enhancing nutrient uptake and performance through the full plant growth cycle.

## Better for the Community

Our way of farming offers:

- **Less runoff.** When soil microbes help keep nutrients in the soil and available to plants, they also reduce phosphorous and nitrogen runoff — protecting water supplies and reducing farm losses.
- **Nutrient efficiency.** Increased nutrient efficiency means big reductions in nitrogen use. In addition to saving you money, this can also cut greenhouse gas emissions associated with products grown on a farm. As more food companies seek to make claims connected to climate, some farmers may get premiums for reducing their impacts.
- **Soil organic matter.** We help you increase soil organic matter, a process that takes carbon out of the atmosphere, puts it into your soil and makes your soil much more productive. Soil carbon also improves water-use efficiency.
